Student Name: Leo Vince A. Quezon

Group: CRLWND

Assigned Role: CLI Developer

What did I contribute to the project?

I hosted the Github repository as well as did some coding for CLI

What features did I personally develop?

Basic CLI commands, including help.

What problems did I encounter?

Figuring out git & github repository hosting.

How did I solve those problems?

Googling and trial and error.

What did I learn from this project?

I learnt the basics of CLI and a little more about python. I learnt how to use git and Github to able to host repositories and projects.

Evidence of my contribution:

```
    def __init__(self, file_manager=None):
        self.file_manager = file_manager or FileManager()
        self.commands = {}
        self.register_command("help", self._help, "Show available
commands")
        self.register_command("clear", self._clear, "Clear the screen")
        self.register_command("date", self._date, "Show the current date")
        self.register_command("time", self._time, "Show the current time")
        self.register_command("whoami", self._whoami, "Show the current
user")
        self.register_command("systeminfo", self._systeminfo,
                              "Show simulated system information")
        self.register_command("exit", self._exit, "Shut down MiniOS")
```

```
except ValueError as error:
            print(f"Error: {error}")
            return True

        if not parts:
            return True

        command, args = parts[0].lower(), parts[1:]
        registered = self.commands.get(command)
        if registered is not None:
            handler, _ = registered
            try:
                output = handler(args)
            except FSError as error:
                print(f"Error: {error}")
                return True
        elif command in FileManager.COMMANDS:
            try:
                output = self.file_manager.execute(command, args)
            except FSError as error:
                print(f"Error: {error}")
                return True
        else:
            print(f"Error: '{command}' is not recognized. Type 'help' for
commands.")
            return True

        if output:
            print(output)
        return command != "exit"
```
